### DETAILED ACTION

1. Claims 1-20 are presented for examination.
2. Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 250 words. It is important that the abstract not exceed 250 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

The current abstract should be amended to better summarize the inventive function or the "result" achieved which is that a large data base may be memory mapped. From the instant disclosure it would appear that such a data base would be stored in ROM which does not appear likely.

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

Claims 1-20 are rejected under 35 U.S.C. 102(e) as being anticipated by the prior art U.S.

Patent 5,301,302 to Blackard et al.

Art Unit: 2771

The applicant's invention of simulating executable code and then memory mapping data into virtual memory is taught by the prior art reference as follows:

In claim 1, the prior art reference teaches the method of the claimed invention. The step of converting a read only file into an executable file is taught by the reference as the simulator copies data and instructions from Read Only Storage (ROS) into the operating system's shared memory segment. (See Col. 8 line 21 et seq.) The further step of memory mapping the converted file into memory is taught by the reference as the memory mapping whereby addresses of a one segment of memory are mapped into a second segment of memory. (See Col. 16 line 21 et seq.)

Claims 7 and 13 are rejected in the analysis above and are rejected on that basis.

In claim 2, the virtual memory is taught by the reference on Col. 16 line 42 et seq.

In claim 3, the operating system loader is shown by the reference on Col. 16 line 21 et seq.

In claim 4, the shared memory is taught by the reference as the shared memory segments taught on Col 16 line 21.

In claim 5, the read only file being a data base file is inherent in the teaching of the reference in that the data in the read only file may be formatted as a database.

In claim 6, the wrapping of the read only file with executable code is inherent in the reference teaching of instruction address translation (See Col. 13 line 22 et seq.)

Claims 8-12 and 14-18 are rejected in the analysis above and are rejected on that basis.

Claims 19 and 20 recite an image file and an audio file but the type of data and type of file is inherent in the teaching of the reference and the data could be either image or audio.
